

FACT SHEET | Mobile Medic

The Combat Lifesaver (CLS) Classroom Training Application or Mobile Medic is a mobile training application for assisting student understanding of course material during the CLS course. When used with existing skill labs, it will allow students to become more familiar with fundamental skills while allowing instructors to focus on more advanced procedures during the skill lab. The application is designed to be used in a 5-10 minute window between the presentation of classroom material and a skill lab for minimal impact to the overall length of the CLS course.

Different scenarios are presented to a student covering the different course lessons. The training application tests the student's comprehension of course materials by allowing them to select treatment interventions for each casualty presented within a scenario. These scenarios force the student to make choices from initial assessment of the casualty to requesting an evacuation. Immediate feedback is provided to confirm correct actions and to notify a student about incorrect actions. Multiple correct decision paths are allowed since in real medical emergencies, there are often multiple treatments or interventions that result in acceptable care. The After-Action Review can instruct a student on better treatment methods if the most acceptable sequence of treatment interventions was not chosen by the student. A scoring system also allows student to measure their performance against other students in the class.

The application was designed to run on a mobile device, such as a cell phone. However, it can be used on any device that supports Adobe Flash. Mobile devices provide a smaller physical footprint resulting in less intrusion to classroom desk space. This capability gives students the ability to quickly jump into a training scenario before and after CLS classes, or in between skill labs and field exercises. Outside of the classroom, mobile devices are an excellent delivery platform that helps make training accessible anywhere, anytime.

Whether in the classroom, or prior to mission deployment, the CLS Classroom Training Application will help future soldiers to be better prepared for medical emergencies.
